PROJECT DEVELOPMENT PHASE

1. PHASE OVERVIEW

The Project Development Phase focuses on the actual implementation of the Auto Ticket Classification using Flow Designer project in the ServiceNow platform.

Based on the requirements, system design, and implementation plan prepared in the previous phases, the required table, fields, choices, dependencies, Flow Designer automation, and email notification are configured.

The main objective of this phase is to develop a working ServiceNow solution that automatically classifies IT support tickets based on the information provided in the Short Description.

2. DEVELOPMENT OBJECTIVES

The main objectives of this phase are:

1. To create the custom ticket management table.
2. To configure the required ticket fields.
3. To configure Category and Subcategory choices.
4. To establish Category–Subcategory dependency.
5. To create the Flow Designer automation.
6. To configure ticket classification conditions.
7. To automatically update Category and Subcategory.
8. To configure automated email notification.
9. To activate and verify the developed flow.
10. To prepare the system for testing.

3. SERVICE NOW ENVIRONMENT

The project is developed using the ServiceNow platform.

The development environment includes:

Platform: ServiceNow
Application: Global
Automation: Flow Designer

Ticket Management: Custom Incident Workflow table
Notification: Flow Designer Send Email action

4. CUSTOM TICKET TABLE CREATION

A custom table named:

Custom Incident Workflow

is created to store IT support ticket information.

The table is designed to maintain the required information related to each support request.

The project source specifies the custom table and its required fields as part of the backend development.

5. FIELD CONFIGURATION

The following fields are configured in the custom ticket table:

Field | Type / Purpose
Number | Auto Number
Caller | Reference
Category | Choice
Subcategory | Dependent Choice
Short Description | String
Description | String
State | Choice
Assigned Group | Reference
Assigned To | Reference

These fields provide the required structure for creating and managing IT support tickets.

6. CATEGORY CONFIGURATION

The Category field is configured with the following values:

Network

Hardware

Access

Performance

These values represent the major types of IT support issues handled by the system.

7. SUBCATEGORY CONFIGURATION

The Subcategory field is configured with the following values:

Wi-Fi

Projector

Forgot Password

Slow Computer

The Subcategory field is configured as a dependent choice field.

8. CATEGORY–SUBCATEGORY DEPENDENCY

The dependency between Category and Subcategory is configured as follows:

Category | Subcategory
Network | Wi-Fi
Hardware | Projector
Access | Forgot Password
Performance | Slow Computer

This configuration ensures that the Subcategory is associated with the appropriate Category.

The project source specifies configuring the Subcategory field as dependent on the Category field.

9. FLOW DESIGNER DEVELOPMENT

The main automation of the project is developed using ServiceNow Flow Designer.

A flow named:

Auto Ticket Classification

is configured to automatically classify newly created IT support tickets.

The Flow Designer provides a no-code approach for implementing the classification logic.

10. FLOW TRIGGER CONFIGURATION

The flow is configured with the following trigger:

Trigger: Record Created

The flow starts automatically whenever a new ticket record is created.

A condition is also configured to check whether the Category field is empty before applying the classification logic.

11. CLASSIFICATION CONDITIONS

The Flow Designer is configured with conditions based on the Short Description.

The classification conditions include:

Wi-Fi Condition

If the Short Description contains:

WiFi

the system assigns:

Category → Network

Subcategory → Wi-Fi

Projector Condition

If the Short Description contains:

Projector

the system assigns:

Category → Hardware

Subcategory → Projector

Password Condition

If the Short Description contains:

password

the system assigns:

Category → Access

Subcategory → Forgot Password

Slow Computer Condition

If the Short Description contains:

slow

the system assigns:

Category → Performance

Subcategory → Slow Computer

The project source defines these classification conditions and their corresponding Category and Subcategory values.

12. UPDATE RECORD ACTION

For each classification condition, an Update Record action is configured.

The Update Record action updates the ticket with the appropriate:

Category

Subcategory

This allows the system to automatically store the classification result in the ticket record.

13. EMAIL NOTIFICATION DEVELOPMENT

An automated email notification is added to the Flow Designer.

A Send Email action is configured to send a confirmation message to the caller after the ticket is created.

The email notification informs the caller that the support request has been successfully submitted.

The project source specifies the use of the Send Email action and provides the notification message structure.

14. COMPLETE FLOW IMPLEMENTATION

The developed automation follows this sequence:

New Ticket Created

↓

Record Created Trigger

↓

Check Category is Empty

↓

Check Short Description

↓

Identify Issue Keyword

↓

Assign Category

↓

Assign Subcategory

↓

Update Ticket Record

↓

Send Email Notification

↓

Completed

This automation reduces the need for manual ticket classification.

15. DEVELOPED CLASSIFICATION LOGIC

The final classification logic implemented in the Flow Designer is:

Issue | Category | Subcategory
WiFi | Network | Wi-Fi
Projector | Hardware | Projector

Password | Access | Forgot Password
Slow | Performance | Slow Computer

The classification logic is based on the predefined conditions specified for the project.

16. FLOW ACTIVATION

After configuring all required triggers, conditions, and actions, the Flow Designer flow is activated.

The activation ensures that the automation can execute when a new ticket is created.

Before moving to testing, the following are verified:

Trigger configuration.

Category condition.

Classification conditions.

Update Record actions.

Send Email action.

Flow activation.

17. DEVELOPMENT VERIFICATION

The developed components are checked to ensure that they are correctly configured.

Component | Development Status
Custom Ticket Table | Completed
Required Fields | Completed
Category Choices | Completed
Subcategory Choices | Completed
Category Dependency | Completed
Flow Trigger | Completed
Classification Conditions | Completed
Update Record Actions | Completed
Email Notification | Completed
Flow Activation | Completed

18. DEVELOPMENT OUTPUT

The major output of the development phase is a functional ServiceNow ticket classification system.

The developed system is capable of:

Creating IT support tickets.

Reading the Short Description.

Identifying predefined issue keywords.

Assigning Category automatically.

Assigning Subcategory automatically.

Updating the ticket record.

Sending an email notification to the caller.

19. PHASE 5 OUTCOME

At the end of the Project Development Phase, the following components are completed:

1. Custom ticket table.
2. Required ticket fields.
3. Category configuration.
4. Subcategory configuration.
5. Category–Subcategory dependency.
6. Flow Designer automation.
7. Ticket classification conditions.
8. Update Record actions.
9. Automated email notification.
10. Flow activation and development verification.

20. CONCLUSION

The Project Development Phase implements the designed solution in the ServiceNow platform.

The custom ticket table and required fields are created, Category and Subcategory choices are configured, and the dependency between them is established.

The Auto Ticket Classification Flow Designer automation is then developed using predefined conditions to identify Wi-Fi, projector, password, and slow computer issues.

The flow automatically updates the ticket with the appropriate Category and Subcategory and sends an email notification to the caller.

The completed development provides a functional foundation for the next phase, Project Testing Phase, where the system will be tested using different IT support scenarios.
