PROJECT TESTING PHASE

1. PHASE OVERVIEW

The Project Testing and Validation Phase focuses on testing the completed Auto Ticket Classification using Flow Designer project to ensure that all implemented features work correctly.

The system is tested using different IT support ticket scenarios. Each ticket is created with a specific Short Description, and the Flow Designer automation is used to identify the issue and automatically assign the appropriate Category and Subcategory.

The testing process also verifies the correctness of ticket data and the automated email notification sent to the caller.

The main purpose of this phase is to ensure that the developed system performs according to the defined project requirements.

2. TESTING OBJECTIVES

The main objectives of this phase are:

1. To test the complete ticket classification workflow.

2. To verify automatic Category assignment.

3. To verify automatic Subcategory assignment.

4. To test different types of IT support issues.

5. To verify Category and Subcategory dependency.

6. To validate the ticket information stored in the system.

7. To verify the automated email notification.

8. To identify any errors in the implemented automation.

9. To ensure that the system produces the expected output.

3. TESTING METHODOLOGY

The project is tested by creating sample IT support tickets with different issue descriptions.

The following process is followed for each test case:

1. Open the ticket creation form.

2. Enter the Caller.

3. Enter the required Short Description.

4. Submit the ticket.

5. Allow the Flow Designer automation to execute.

6. Reload the ticket record.

7. Check the Category field.

8. Check the Subcategory field.

9. Verify that the values match the expected classification.

10. Verify the email notification sent to the caller.

4. TEST CASE 1 – WI-FI ISSUE

Test Input

Short Description:

WiFi not working in library

Expected Output

Category: Network

Subcategory: Wi-Fi

Testing Result

The system identifies the Wi-Fi-related keyword and automatically classifies the ticket under the Network category with Wi-Fi as the Subcategory.

The project instructions specifically provide this as a testing scenario for validating the Wi-Fi classification.

Result: Passed

5. TEST CASE 2 – PROJECTOR ISSUE

Test Input

Short Description:

Projector not turning on

Expected Output

Category: Hardware

Subcategory: Projector

Testing Result

The system identifies the projector-related keyword and automatically assigns Hardware as the Category and Projector as the Subcategory.

The project document specifies this scenario for validating projector classification.

Result: Passed

6. TEST CASE 3 – PASSWORD ISSUE

Test Input

Short Description:

Forgot password

Expected Output

Category: Access

Subcategory: Forgot Password

Testing Result

The system identifies the password-related keyword and automatically assigns Access as the Category and Forgot Password as the Subcategory.

Result: Passed

7. TEST CASE 4 – SLOW COMPUTER ISSUE

Test Input

Short Description:

Slow computer

Expected Output

Category: Performance

Subcategory: Slow Computer

Testing Result

The system identifies the slow computer-related keyword and automatically assigns Performance as the Category and Slow Computer as the Subcategory.

Result: Passed

8. TEST CASE SUMMARY

Test Case | Input / Issue | Expected Category | Expected Subcategory | Result

TC-01 | WiFi not working in library | Network | Wi-Fi | Passed

TC-02 | Projector not turning on | Hardware | Projector | Passed

TC-03 | Forgot password | Access | Forgot Password | Passed

TC-04 | Slow computer | Performance | Slow Computer | Passed

The test cases verify the major classification conditions implemented in the Flow Designer.

9. EMAIL NOTIFICATION TESTING

The automated email notification is tested after creating and processing the ticket.

Testing Steps

1. Create a new IT support ticket.

2. Enter the Caller.

3. Enter the Short Description.

4. Submit the ticket.

5. Wait for the Flow Designer to execute.

6. Open the ServiceNow email records.

7. Search for the configured email subject.

8. Open the generated email.

9. Select Preview Mail.

10. Verify the recipient, subject, and message body.

The project instructions specify verifying the generated email from the ServiceNow email logs.

Expected Result

The caller should receive an email confirming that the support request has been submitted.

Result: Passed

10. DATA VALIDATION

The ticket records are also checked to ensure that the information is stored correctly.

The following fields are validated:

Number

Caller

Category

Subcategory

Short Description

Description

State

Assigned Group

Assigned To

The validation ensures that the ticket information is stored correctly and that the configured fields contain the expected values.

11. FUNCTIONAL VALIDATION

The following functional requirements are verified:

Functional Requirement | Validation Status

Ticket Creation | Passed

Flow Trigger | Passed

Keyword Identification | Passed

Category Assignment | Passed

Subcategory Assignment | Passed

Category–Subcategory Dependency | Passed

Ticket Update | Passed

Email Notification | Passed

Data Storage | Passed

The results indicate that the major functional components of the system are working as expected.

12. ERROR IDENTIFICATION AND CORRECTION

During testing, the system is checked for incorrect classification or missing automation.

The following areas are verified:

Incorrect Category assignment.

Incorrect Subcategory assignment.

Missing keyword condition.

Flow execution failure.

Incorrect dependent choice.

Incorrect email recipient.

Missing email notification.

Incorrect ticket field values.

If any issue is identified, the corresponding Flow Designer condition, action, field configuration, or notification setting is reviewed and corrected before final validation.

13. FINAL VALIDATION

After completing the individual test cases, the complete workflow is tested again.

The final workflow is:

Create Ticket

Record Created Trigger

Check Short Description

Identify Keyword

Assign Category

Assign Subcategory

Update Ticket

Send Email Notification

Verify Final Output

The final validation confirms that the complete process works from ticket creation to final notification.

14. TESTING OUTCOME

The testing activities demonstrate that the system can:

Create IT support tickets.

Identify predefined issue keywords.

Automatically classify tickets.

Assign the correct Category.

Assign the correct Subcategory.

Maintain dependent Category and Subcategory values.

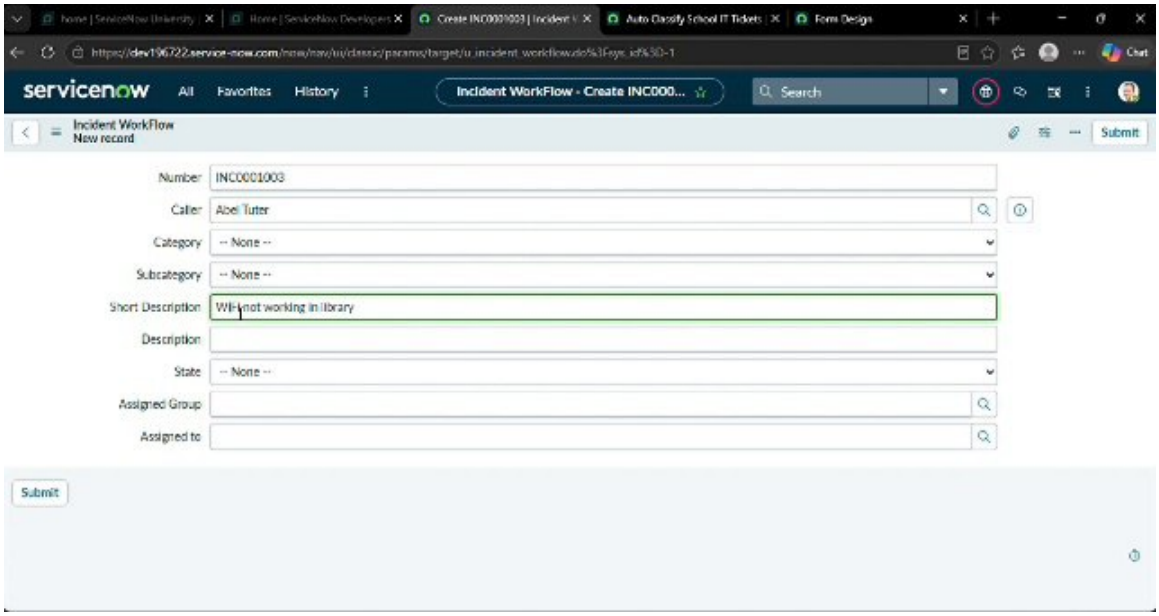

Update ticket records automatically.

Send email notifications.

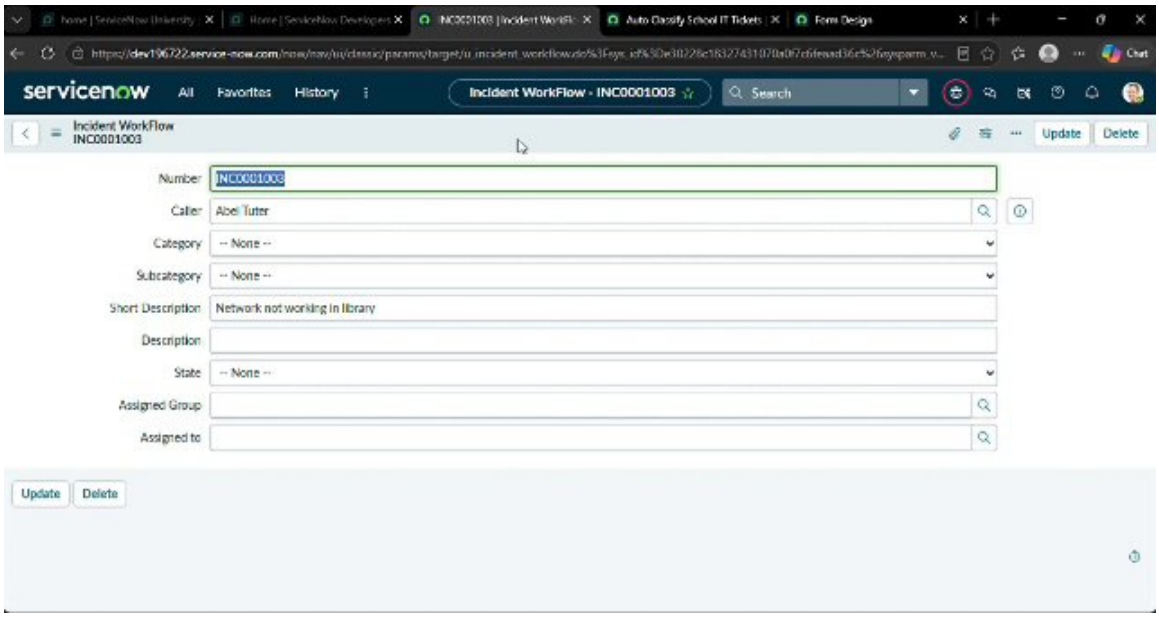

Store ticket information correctly.

Test Completion

15. PHASE 6 OUTCOME

At the end of this phase, the following activities are completed:

1. Ticket classification testing.

2. Wi-Fi issue testing.

3. Projector issue testing.

4. Password issue testing.

5. Slow computer issue testing.

6. Category validation.

7. Subcategory validation.

8. Email notification testing.

9. Ticket data validation.

10. Final workflow validation.

The successful completion of these activities confirms that the implemented system satisfies the required functional behavior.

16. CONCLUSION

The Project Testing and Validation Phase verifies the functionality of the Auto Ticket Classification using Flow Designer system.

Different IT support scenarios are tested to confirm that the system correctly identifies the issue and automatically assigns the appropriate Category and Subcategory.

The email notification functionality is also tested to ensure that the caller receives confirmation after submitting a ticket. Ticket data and the complete automation workflow are validated to ensure consistent system behavior.

Overall, the testing and validation process confirms that the developed ServiceNow solution performs the required automated ticket classification process and is ready for final documentation and project demonstration.
