PROJECT DOCUMENTATION

1. PHASE OVERVIEW

The Project Documentation Phase focuses on preparing complete and organized documentation for the Auto Ticket Classification using Flow Designer project.

Documentation is an important part of the project because it provides a clear record of the project requirements, design, configuration, implementation, testing, and final results.

The documentation describes how the ServiceNow environment was configured, how the ticket classification process was automated using Flow Designer, how different ticket scenarios were tested, and how the final output was verified.

The main objective of this phase is to prepare all required project documents in a structured format for submission, review, maintenance, and future reference.

2. DOCUMENTATION OBJECTIVES

The main objectives of this phase are:

1. To prepare complete documentation for the project.

2. To document the project requirements and objectives.

3. To document the system design and workflow.

4. To document the backend table and field configuration.

5. To document the Category and Subcategory dependency.

6. To document the Flow Designer automation.

7. To document the ticket classification logic.

8. To document the email notification process.

9. To document the testing and validation results.

10. To maintain all project-related files in an organized manner.

3. PROJECT DOCUMENTATION STRUCTURE

The project documentation is organized into the following major sections:

3.1 Project Title

Auto Ticket Classification using Flow Designer

3.2 Project Overview

The project provides an automated solution for classifying
school IT support tickets using ServiceNow Flow Designer.

3.3 Problem Identification

The documentation explains the problems associated with
manually reviewing and classifying IT support tickets.

3.4 Proposed Solution

The proposed solution uses Flow Designer to identify
keywords from ticket descriptions and automatically assign Category and
Subcategory values.

3.5 Project Objectives

The objectives describe the expected functionality and
benefits of the automated ticket classification system.

3.6 System Configuration

The documentation includes the configuration of the custom
ticket table, fields, choices, references, and Category–Subcategory dependency.

3.7 Flow Designer Automation

The documentation describes the trigger, conditions,

actions, and email notification configured in Flow Designer.

3.8 Testing and Validation

The documentation includes the different test scenarios used to verify automatic ticket classification and email notification.

4. BACKEND CONFIGURATION DOCUMENTATION

The backend configuration is documented to provide details about the ticket table and its fields.

The major fields documented include:

Number

Caller

Category

Subcategory

Short Description

Description

State

Assigned Group

Assigned To

The documentation also describes the available Category and Subcategory values and their dependency relationship.

5. CATEGORY AND SUBCATEGORY DOCUMENTATION

The Category and Subcategory configuration is documented as follows:

Category
Subcategory

Network
Wi-Fi

Hardware
Projector

Access | Forgot Password

Performance | Slow Computer

This dependency ensures that the appropriate Subcategory is associated with the selected Category.

6. FLOW DESIGNER DOCUMENTATION

The Flow Designer implementation is documented to explain how the automatic classification process works.

The flow is designed with:

Record Created trigger.

Category empty condition.

Wi-Fi classification condition.

Projector classification condition.

Password classification condition.

Slow Computer classification condition.

Update Record actions.

Send Email action.

The Flow Designer documentation explains how these

components work together to automatically classify IT support tickets.

7. TICKET CLASSIFICATION DOCUMENTATION

The classification logic is documented using the following

mapping:

Issue Keyword

Category | Subcategory

Wi-Fi / Network | Network | Wi-Fi

Projector

Hardware | Projector

Forgot Password | Access | Forgot Password

Slow Computer

Performance | Slow Computer

This table provides a clear representation of the classification rules implemented in the project.

8. EMAIL NOTIFICATION DOCUMENTATION

The documentation also includes the automated email notification process.

The email notification is configured to be sent to the caller after the ticket is created and processed.

The documentation records:

Email action.

Recipient.

Subject.

Message body.

Notification verification.

This provides a clear record of the communication functionality implemented in the project.

9. TESTING DOCUMENTATION

The testing section documents the different ticket scenarios

used to verify the system.

The main test cases include:

1. Wi-Fi issue.

2. Projector issue.

3. Forgot Password issue.

4. Slow Computer issue.

Each test case contains:

Test input.

Expected Category.

Expected Subcategory.

Testing procedure.

Test result.

The testing documentation helps demonstrate that the implemented automation performs the expected classification.

10. TEST RESULT DOCUMENTATION

The test results are documented as follows:

Test Case | Input | Expected Category

Expected Subcategory | Result

---------- | ----------

TC-01 | WiFi not
working in library | Network
Wi-Fi | Passed

TC-02
Projector not turning on
Hardware | Projector | Passed

TC-03 | Forgot
password | Access | Forgot Password | Passed

TC-04 | Slow
computer | Performance | Slow Computer | Passed

The results provide evidence that the main classification conditions work according to the defined requirements.

11. SCREENSHOT DOCUMENTATION

Screenshots are included as supporting evidence of the project implementation.

The screenshots may include:
Custom table configuration.
Field configuration.

Category configuration.

Subcategory configuration.

Dependent field configuration.

Flow Designer trigger.

Flow Designer conditions.

Update Record actions.

Send Email action.

Ticket creation.

Automatically classified ticket.

Email notification.

Testing results.

Screenshots provide visual evidence of the configuration and execution of the project.

12. UPDATE SET DOCUMENTATION

The project documentation also records the Update Set used to capture the configuration changes.

The documented configuration includes:

Custom table.

Required fields.

Choice configurations.

Category–Subcategory dependency.

Flow Designer automation.

Email notification configuration.

The Update Set information helps maintain the project configuration and supports deployment activities.

13. PROJECT FILE ORGANIZATION

All project-related documents and supporting files are organized systematically.

The project documentation may include:

```text id="c4wq3x"

Auto Ticket Classification using Flow Designer

│

├── Phase 1 –
Brainstorming and Ideation

├── Phase 2 –
Backend Development and Configuration

├── Phase 3 –
Automation using Flow Designer

├── Phase 4 –
Testing, Validation and Security
```

├── Phase 5 –

Deployment and Final Verification

├── Phase 6 –

Project Testing and Validation

└── Phase 7 – Project Documentation

This organization makes it easier to review and maintain the project files.

14. DOCUMENTATION CHECKLIST

No. | Documentation Item | Status

---

1 | Project Overview | Completed

2 | Problem Identification | Completed

3 | Proposed Solution | Completed

4 | Project

Objectives | Completed

5 | Backend Configuration | Completed

6 | Flow Designer Configuration | Completed

7 | Ticket Classification Logic | Completed

8 | Email Notification | Completed

9 | Testing and Validation | Completed

10 | Screenshots and Evidence | Completed

11 | Update Set Details | Completed

12 | Final Project Documentation | Completed

15. EXPECTED OUTCOME

The expected outcome of this phase is a complete and organized project documentation package.

The documentation should provide sufficient information to understand:

Why the project was developed.

What problem the project addresses.

How the system is configured.

How the ticket classification works.

How Flow Designer automates the process.

How email notifications are generated.

How the system was tested.

What results were obtained.

16. PHASE 7 OUTCOME

At the end of this phase, the following activities are completed:

1. Project documentation preparation.

2. Backend configuration documentation.

3. Flow Designer documentation.

4. Ticket classification documentation.

5. Email notification documentation.

6. Testing documentation.

7. Test result documentation.

8. Screenshot organization.

9. Update Set documentation.

10. Final project file organization.

The completed documentation provides a structured record of
the project implementation and results.

17. CONCLUSION

The Project Documentation Phase provides a complete written
record of the Auto Ticket Classification using Flow Designer project.

The documentation covers the project overview, problem
identification, proposed solution, backend configuration, Flow Designer
automation, ticket classification logic, email notification, testing,
validation, and final results.

Organizing the project information and supporting evidence
in a structured manner makes the implementation easier to understand, review,

maintain, and demonstrate.

Overall, this phase completes the documentation requirements
of the project and provides a clear reference for the final project submission
and demonstration.
